

FOUNDER PREPARATION

Franchise Mobile x NBA 2K Meeting + Q&A Runbook

A private preparation guide for product, development, online-services, strategy, commercial, security, and diligence conversations.

Franchise Mobile keeps the league connected. NBA 2K remains where basketball is played.

Prepared for a private product and technical evaluation with Take-Two Interactive, 2K, and Visual Concepts.

Non-confidential presentation layer. No source code, credentials, private formulas, raw datasets, or repository access included.

Meeting posture

Lead with

- A clear product problem: franchise leagues lose continuity between console sessions.
- A focused proposal: a mobile social and front-office companion for MyNBA and MyGM.
- Working evidence: a seeded multi-team prototype with league operations, social systems, schedules, game evidence, and CPU continuity.
- A narrow next step: a product and technical evaluation followed by a sandbox pilot if fit is confirmed.

Do not volunteer

- Source code, repository access, service-account keys, passwords, Firebase Console access, environment files, or production data.
- Simulation formulas, CPU decision weights, rating methodology, raw player datasets, unreleased modes, or monetization experiments.
- Unverified traction, revenue, retention, market-size, or user-count claims.
- A claim that the product is licensed, affiliated, approved, or technically integrated with 2K today.

Answer what is known. Label assumptions. Offer written follow-up when the exact answer requires 2K-owned technical context.

Prepared questions and answers

1. What exactly are you asking us to evaluate?

A focused MyNBA/MyGM companion concept: mobile league management, community, commissioner operations, and matchup preparation synchronized with NBA 2K, while console or PC remains authoritative for playable games and results.

2. Is this already integrated with NBA 2K?

No. The current app is a working standalone prototype and isolated pitch demo. The NBA 2K service connection is the proposed integration that requires product and technical evaluation with 2K and Visual Concepts.

3. Are you affiliated with the NBA, NBPA, 2K, or Take-Two?

No affiliation or license is claimed. Licensed names, assets, official data, and commercial use would require the appropriate agreements. The pitch is a strategic integration proposal, not a claim of existing authorization.

4. Why should this live inside the 2K ecosystem?

The value is strongest when mobile decisions, community activity, and scheduled matchups return users to the authoritative NBA 2K experience. A first-party connected layer can reduce fragmentation and give franchise leagues a persistent identity.

5. Why not just use Discord and spreadsheets?

Those tools handle isolated pieces but do not understand league state, permissions, teams, schedules, trades, results, player evaluation, commissioner workflows, or the return-to-game loop as one product.

6. Does a public NBA 2K API exist for this?

This proposal does not assume one exists. The exact account-linking, permission, event, and synchronization contract must be defined with 2K and Visual Concepts through a controlled service interface.

7. What does Franchise Mobile contribute?

The mobile operating layer: league dashboard, schedule, communication, moderation, trades, player intelligence, coaching preparation, CPU vacancy continuity, alerts, voting, standings, stats, awards, and offseason management.

Prepared questions and answers (continued)

8. What stays under 2K control?

Licensed content, authoritative rosters and ratings, playable basketball, gameplay outcomes, account identity, entitlements, anti-cheat, platform services, and the final synchronization and conflict-resolution contract.

9. How would you prevent conflicting changes?

The proposed architecture uses server-authoritative state, scoped permissions, event-based synchronization, idempotent operations, version checks, and 2K-controlled conflict resolution. The exact design would be part of technical discovery.

10. What happens when a GM is absent?

The prototype supports CPU-controlled vacancies so schedules and league activity can continue. A commissioner can control whether CPU simulation or CPU trading is permitted.

11. How do you keep CPU trades fair?

CPU identity considers team direction, roster needs, competitive window, roster balance, contract context, and value. The proprietary weights are reserved for protected technical diligence rather than first-meeting disclosure.

12. What is working today?

The isolated demo contains 30 franchises, 530 rostered players, a locked 1,230-game schedule, seeded completed games, box scores, league statistics, social and moderation flows, trade operations, commissioner tools, and founder/viewer roles.

13. How many users or how much revenue do you have?

This pitch is currently based on product proof and strategic fit. I will not present unverified traction. Any validated usage or commercial data can be supplied separately when it is ready.

14. What is the business model?

The initial goal is to establish product and technical fit. Licensing, partnership, acquisition, platform inclusion, premium connected features, or another structure should be evaluated with Take-Two and 2K after the integration opportunity is validated.

Prepared questions and answers (continued)

15. Why start with MyNBA and MyGM?

The prototype already demonstrates the league, commissioner, front-office, social, and CPU-continuity systems those modes need. That creates the clearest and lowest-ambiguity starting point.

16. Where does MyCAREER fit?

As a later roadmap. The same community infrastructure could support teammate discovery, squads, availability, scheduled sessions, organized competition, events, and persistent social identity after the franchise loop proves itself.

17. How will you handle harassment and moderation?

The prototype includes reporting, blocking, league moderation, and commissioner controls. A production integration would align with 2K policy, platform safety requirements, auditability, escalation, and account enforcement.

18. How is the demo secured?

It uses a separate Firebase project, separate founder and viewer roles, read-only external access, seeded sample data, no production credentials, no repository access, and revocable recipient-specific accounts.

19. Can our engineers inspect the repository now?

Not during initial evaluation. I can provide architecture summaries and answer product questions. Source access should occur only in a separately authorized diligence stage with confirmed recipients and appropriate protections.

20. What would a pilot look like?

A product workshop, technical discovery, one limited sandbox league, controlled participant access, a narrow synchronization loop, and agreed measures for reliability, league activity, return-to-game behavior, and user value.

21. What do you need from us next?

A meeting with NBA 2K product leadership, Visual Concepts MyNBA/MyGM ownership, and 2K online or mobile services to determine fit, technical constraints, and whether a sandbox prototype should be explored.

Meeting close and follow-up

Before ending the call

- Restate the proposed first integration in one sentence.
- Confirm whether the opportunity belongs with product, development, online services, strategy, or another internal owner.
- Ask what information is needed for the next evaluation step.
- Agree on one owner and a specific follow-up date.
- Do not send additional files until recipients and purpose are confirmed.

After the call

- Record attendees, roles, questions, materials requested, commitments, and next action.
- Send a concise recap within 24 hours.
- Create or extend viewer access only for named recipients and record an expiration date.
- Revoke access after the window closes and review activity for unexpected use.
- Move sensitive requests into a separately approved diligence lane.

A good first meeting ends with the right internal owner and a defined evaluation step — not with unrestricted access to the product's protected internals.
